[Wildflower Learning Center & Planting Guides | American Meadows](#)

1. Plan Your Planting. Measure your planting area to find out how much seed you need, and plant at the right time for your climate.

2. Prepare Soil. Prepare your soil by removing all existing growth and debris. Better soil preparation means more flowers!

3. Sow Your Seeds. Follow the coverage rate for your wildflower seeds. If possible, time your planting to let Mother Nature water your seeds.

4. Compress Seeds Into Soil. Good seed-to-soil contact encourages good germination and healthy roots. Do not bury wildflower seeds.

5. Water Your Wildflower Planting. Water regularly to keep soil moist, not soaking wet, until seedlings are about 4-6 inches tall.

6. Watch Growth & Blooms Appear. Sprouts will start in late spring or early summer. Sit back, grab your favorite beverage, and enjoy your wildflowers!
